~~L~~ About limitations of the present study ~~includes the notion that can be said that~~ the subjects ~~represented by~~ of this study were ~~only~~ ~~only from the~~ medical students in Ahvaz, thus, the results can not be generalized to other levels of education, cities, cultures and other universities. Also, studies on the relationship between the five personality traits, particularly rumination with IgA at the country and abroad, ~~were minimal so much so that the present study researchers have found and studied are very low~~. In this context, there is little research to compare the results to. Furthermore, the effect of possible ~~external~~ ~~various~~ factors (such as academic stress or prolonged academic pressures associated with exam periods, stressful life events, etc.) has not been evaluated that simultaneously may have an impact on students' exam stress. ~~Other limitations~~ of this study that may have influenced the results ~~include~~ is the sample size of ~~the~~ research. ~~Because~~ ~~because~~, using a larger sample might reveal ~~more~~ meaningfulness ~~in some of~~ relationships between ~~the~~ variables. ~~For example~~ ~~Example~~, the considerable results of the present study ~~found a~~ ~~was~~ negative correlation between conscientiousness trait and salivary IgA ( $r=-0.23$ ), but ~~it~~ was not statistically significant.

In terms of methodology, we took samples of the salivary IgA two months after assessment of the personality of ~~the~~ subjects. ~~The~~ ~~So the~~ big five personality traits may predict the levels of salivary IgA in the future stressful conditions ~~and~~ ~~So that~~ previous pathological studies have evaluated the use of the Big Five Factor Model of personality in the diagnosis and prognosis of psychiatric diseases such as mood, ~~d~~ Depressive and anxiety disorders (29, 30) and multiple sclerosis (31). ~~A strength~~ ~~Other strengths of~~ ~~strength of~~ this study ~~was~~ ~~ere~~ the use of saliva samples. Salivary IgA ~~has an~~ important role in mucosal immunity and is proved ~~as that~~ a sensitive and objective indicator of stress in ~~humans~~ ~~the human~~. Saliva samples ~~are~~ easily collected and without inconvenience to individuals: ~~with and only~~ ~~with only~~ a small sample volume ~~being~~ ~~is~~ required. ~~E~~ ~~ven~~ in animals (32) salivary IgA ~~is~~ a useful marker of stress. ~~is proposed~~. ~~Using~~ of the Medical students that ~~are frequently~~ ~~are frequently~~ ~~are~~ exposed to heavy examinations stress and academic rumination ~~was~~ ~~ere~~ also ~~a~~ ~~of the~~ ~~strengths of~~ ~~strength of~~ the research sample.
